**Subject:** Exporting Natural Gas

January 21, 2013

The recent study done by NERA on the effects of producing Liquefied Natural Gas (LNG) resulted in positive findings in the following areas: U.S. economy and gross domestic product (GDP), domestic and export needs, and U.S. trade relations. Jobs will be in demand with the need for new liquefaction facilities to convert gas into LNG, which will then be ready for export and domestic use. The average annual increase in revenues from export of LNG could range from \$2.6 billion to almost \$32.9 billion.

Beside this increase from additional production of gas, the revenue of federal and state governments would also see an annual amount ranging in billions of dollars. Another benefit of exporting LNG would be help the potential of helping an ally country, with growing demands for natural gas.

As a veteran, the stability of the U.S is still a top priority of mine. That is why I think the ability to export LNG should be seriously considered.

Thanks for your consideration on this important matter !
