Natural Gas Supply/Demand Notice of Inquiry

Sender Name: Marcy J. Golde

Company/Organization:

An aggressive effort to conserve and reduce consumption of natural gas for heating and electric power generation is currently missing from the efforts of the Department of Energy.

A strong campaign to reduce consumption is needed. Examples include financial and education for: Green building, financial support or tax benefits for home, business and industrial insulation, replacement of all traffic lights with ones using LED bulbs, support for solar and other forms of alternative energy and many, many others would significantly reduce our fossil fuel needs and use. In addition it would reduce the US contribution to CO2 and Climate Change.

We need a concerted move away from fossil fuels, not more development of more gas and oil. The damage to ocean ecosystems from exploration, drilling and production is severe. The CO2 production and the increasing impacts of Climate Change point to the need to move away from fossil fuels and to emphasis conservation to help in the transition period.

Sincerely, Marcy Golde
